

# SMSlingshot

## how does it work

typing a message  
on the wooden keypad  
of the SMSlingshoot  
140 signs are possible

looking for a nice spot on the wall  
where to shoot the message upon

When the flexible ribbon is pulled, a  
laserpointer creates a green point on the facade

By letting loose the ribbon, the message is sent  
to the computer and displayed on the wall
